Perceptual Losses for Real-Time Style Transfer and Super-Resolution

[YouTube Video](#)

"For example, consider two identical images offset from each other by one pixel; despite their perceptual similarity they would be very different as measured by per-pixel losses."

$$W^* = \arg \min_W \mathbb{E}_{x,y} \left[\sum_i \lambda_i \ell_i(\underbrace{f_W(x)}_{\hat{y}}, y) \right]$$

Style transfer: $y_c = x$ & train one network per style target y_s

Super-resolution: $y_c = \text{high-resolution image}$ & style reconstruction loss is not used

Feature Reconstruction Loss

$\phi_j(x) \in \mathbb{R}^{C_j \times H_j \times W_j} \rightarrow \text{activations of the } j\text{-th layer of network } \phi$

$$\ell_{feat}^{\phi,j}(\hat{y}, y) = \frac{1}{C_j H_j W_j} \|\phi_j(\hat{y}) - \phi_j(y)\|_2^2$$

Style Reconstruction Loss

$$G_j^\phi(x)_{c,c'} = \frac{1}{C_j H_j W_j} \sum_{h=1}^{H_j} \sum_{w=1}^{W_j} \phi_j(x)_{h,w,c} \phi_j(x)_{h,w,c'}$$

$G_j^\phi(x) \in \mathbb{R}^{C_j \times C_j} \rightarrow \text{Gram Matrix}$

Gram matrix captures information about which features tend to activate together.

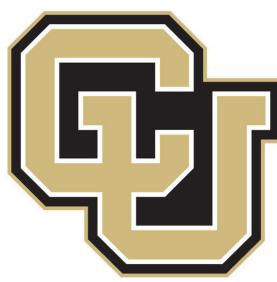

$$\ell_{style}^{\phi,j}(\hat{y}, y) = \|G_j^\phi(\hat{y}) - G_j^\phi(y)\|_F^2$$

$$\hat{y} = \arg \min_y \lambda_c \ell_{feat}^{\phi,j}(y, y_c) + \lambda_s \ell_{style}^{\phi,j}(y, y_s) + \lambda_{TV} \ell_{TV}(y)$$

Speedup over [11] at 100, 300, 500 optimization iterations

Image Size	Speedup		
	100	300	500
256 × 256	212x	636x	1060x
512 × 512	205x	615x	1026x
1024 × 1024	208x	625x	1042x

Image Style Transfer Using Convolutional Neural Networks

Content Representation

$p \rightarrow$ photograph

$x \rightarrow$ generated image (randomly initialized)

$P^l \rightarrow$ feature representation of p at layer l

$F^l \rightarrow$ feature representation of x at layer l

$$\mathcal{L}_{\text{content}}(\vec{p}, \vec{x}, l) = \frac{1}{2} \sum_{i,j} (F_{ij}^l - P_{ij}^l)^2$$

$F_{i,j}^l \rightarrow$ activation of i -th filter at position j in layer l

$$F^l \in \mathbb{R}^{N_l \times M_l}$$

$N_l \rightarrow$ number of feature maps

$M_l \rightarrow$ height times width of the feature map

Style Representation

$$G^l \in \mathbb{R}^{N_l \times N_l} \rightarrow \text{Gram matrix}$$

$$G_{ij}^l = \sum_k F_{ik}^l F_{jk}^l \rightarrow \text{inner product between the vectorized feature maps } i \text{ and } j \text{ in layer } l$$

captures texture but not global arrangement

$a \rightarrow$ artwork image $A^l \rightarrow$ style representation of a

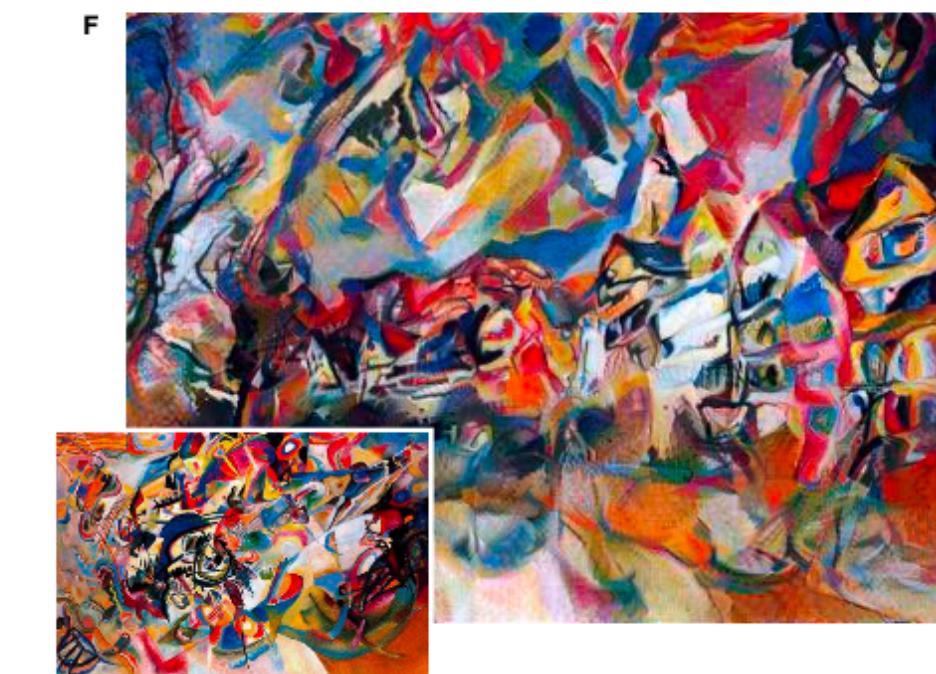

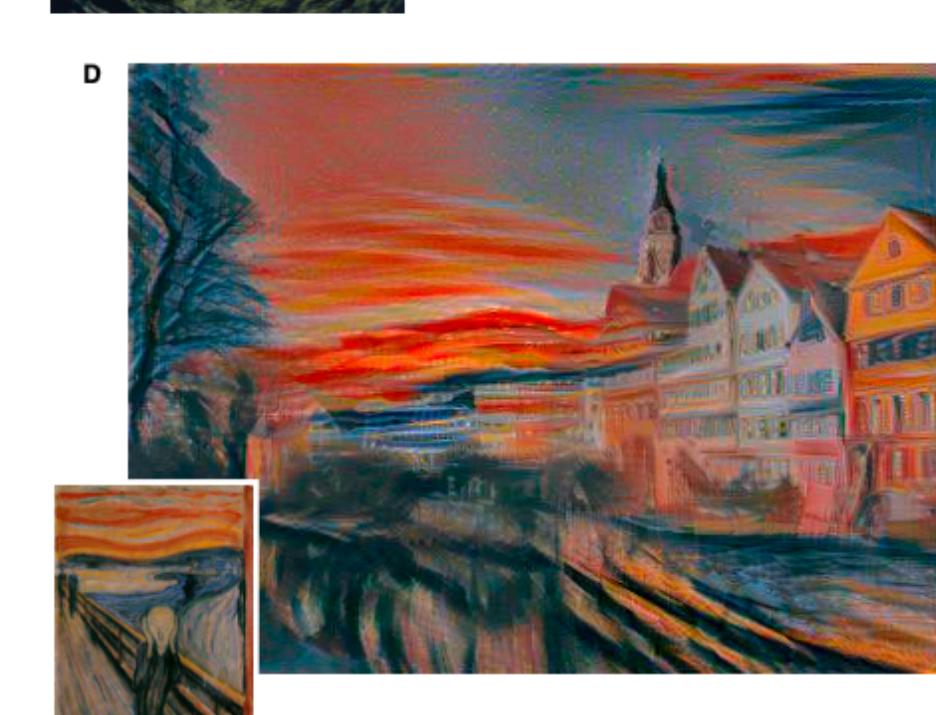

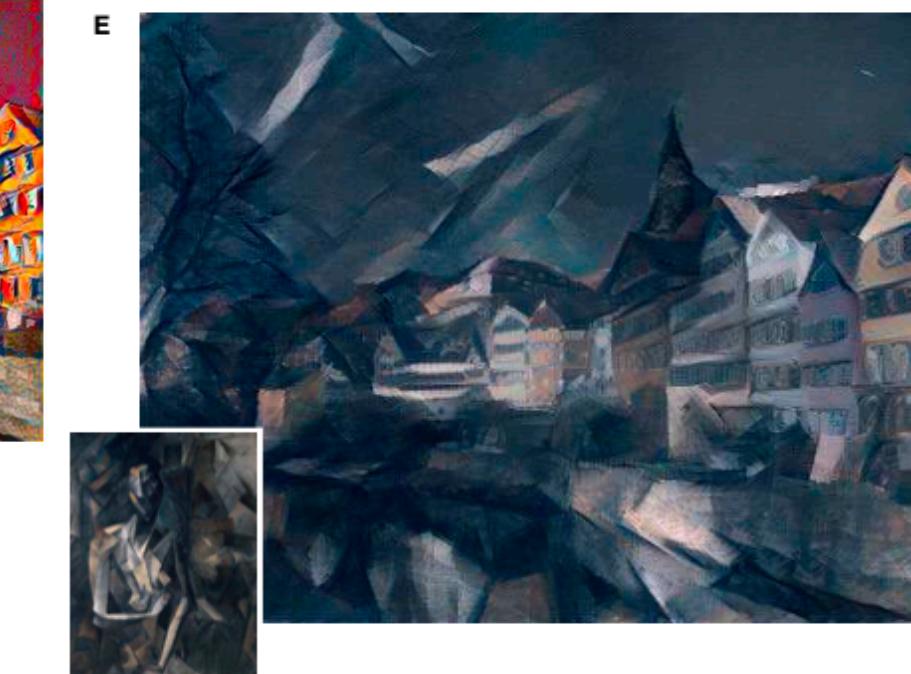

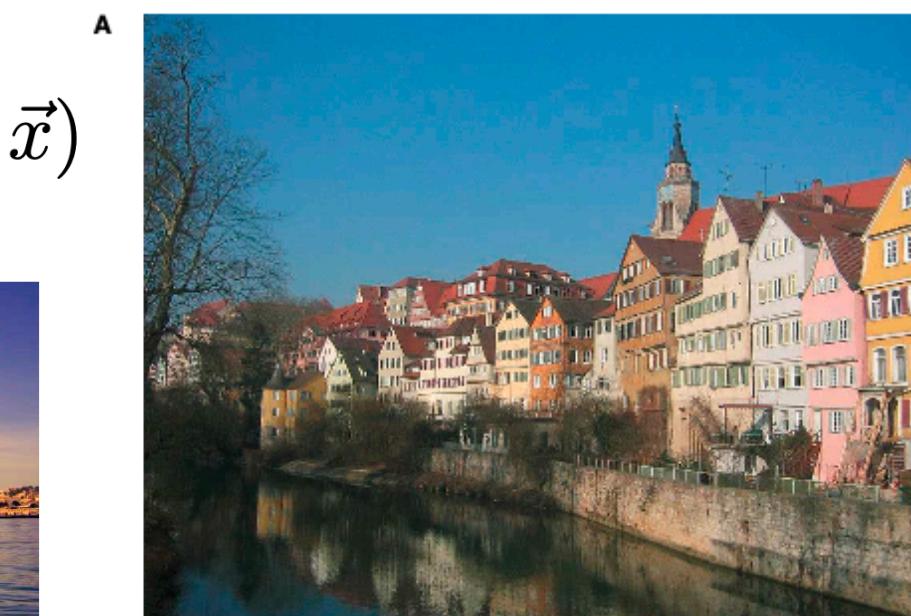

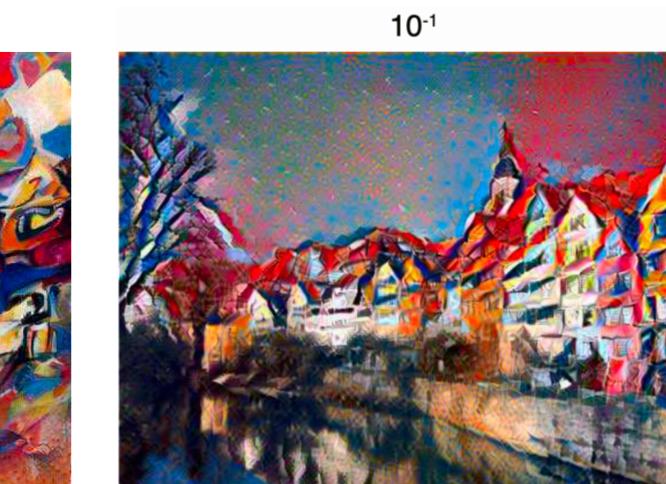

$G^l \rightarrow$ style representation of x

$$\mathcal{L}_{\text{style}}(\vec{a}, \vec{x}) = \sum_{l=0}^L w_l E_l \quad E_l = \frac{1}{4N_l^2 M_l^2} \sum_{i,j} (G_{ij}^l - A_{ij}^l)^2 \quad \boxed{\text{The ratio } \alpha/\beta}$$

Style Transfer

$$\mathcal{L}_{\text{total}}(\vec{p}, \vec{a}, \vec{x}) = \alpha \mathcal{L}_{\text{content}}(\vec{p}, \vec{x}) + \beta \mathcal{L}_{\text{style}}(\vec{a}, \vec{x})$$

$$\frac{\partial \mathcal{L}_{\text{total}}}{\partial \vec{x}}$$

Real-Time Single Image and Video Super-Resolution Using an Efficient Sub-Pixel Convolutional Neural Network

I^{HR} → high-resolution image

I^{LR} → low-resolution image

$I^{\text{LR}} \leftarrow I^{\text{HR}}$
 ▷ Gaussian filter
 ▷ Downsampling

I^{SR} → super-resolved image

r → upscaling ratio

$I^{\text{LR}} \in \mathbb{R}^{H \times W \times C}$

$I^{\text{HR}} \in \mathbb{R}^{rH \times rW \times C}$

avoid upscaling I^{LR}

(i.e., bicubic interpolation)

before feeding into the network

$$f^1(I^{\text{LR}}; W_1, b_1) = \tanh(W_1 * I^{\text{LR}} + b_1)$$

$$f^l(I^{\text{LR}}; W_{1:l}, b_{1:l}) = \tanh(W_l * f^{l-1}(I^{\text{LR}}) + b_l), l = 2, \dots, L-1$$

$$W_l \in \mathbb{R}^{n_{l-1} \times n_l \times k_l \times k_l}, b_l \in \mathbb{R}^{n_l}$$

n_l → number of features at layer l

$n_0 = C, k_l$ → filter size at layer l

Efficient sub-pixel convolution layer

$$\mathbf{I}^{\text{SR}} = f^L(\mathbf{I}^{\text{LR}}) = \mathcal{PS}(W_L * f^{L-1}(\mathbf{I}^{\text{LR}}) + b_L)$$

\mathcal{PS} → periodic shuffling operator

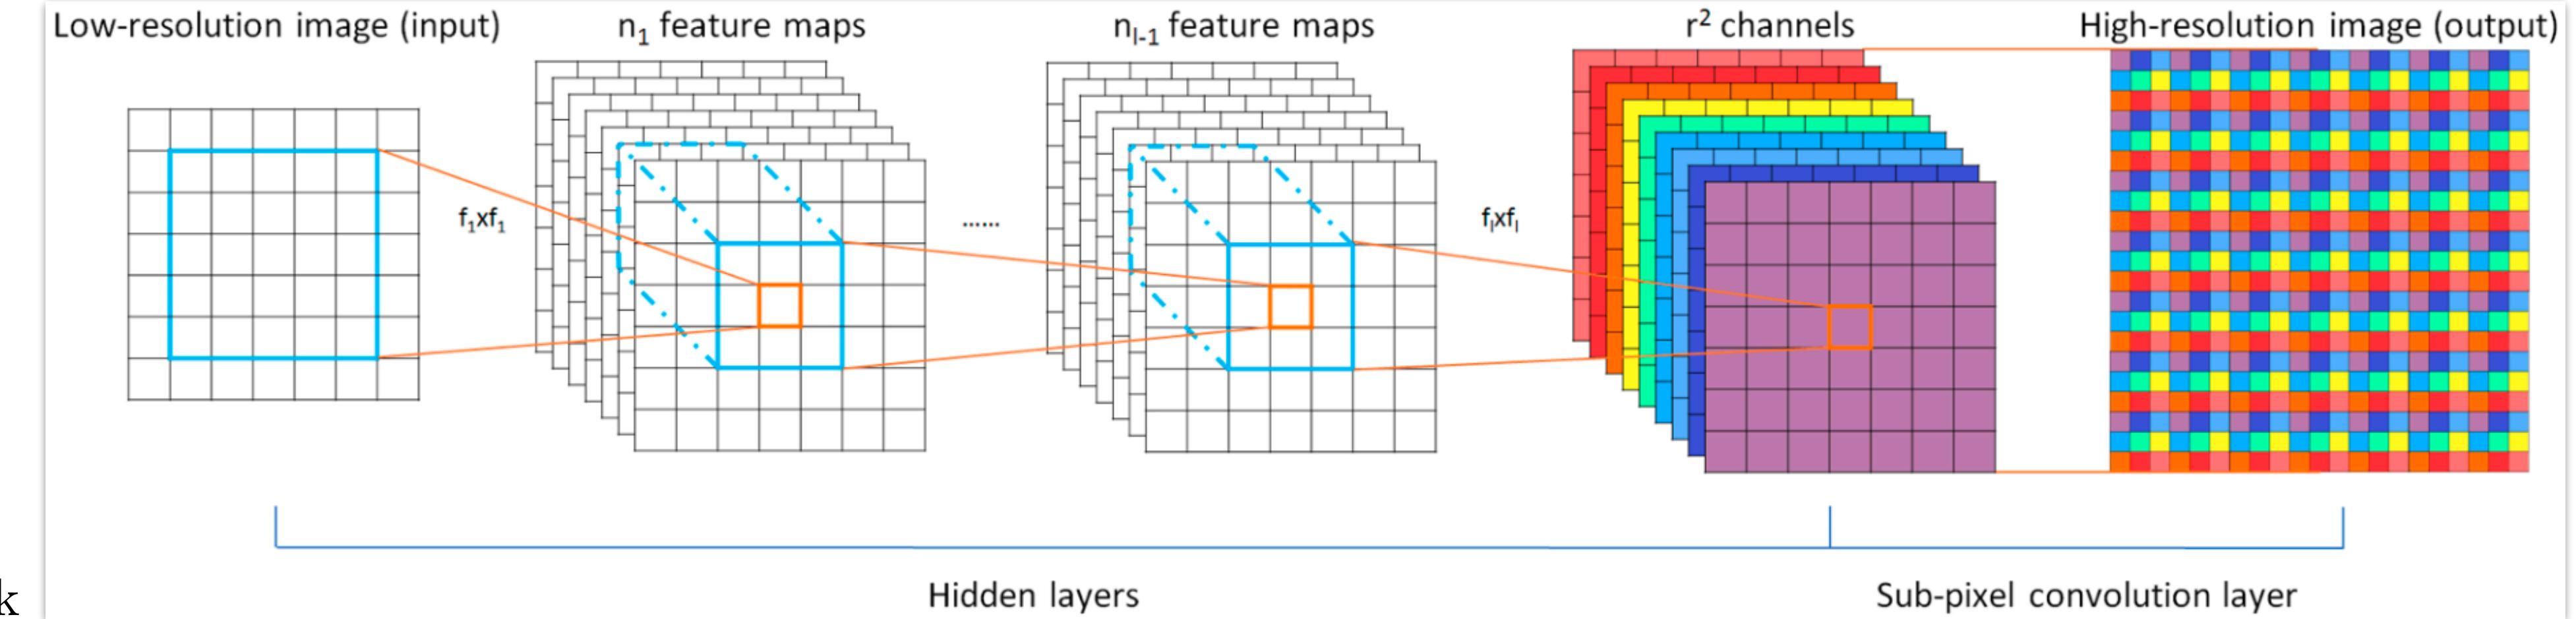

$$H \times W \times C \cdot r^2 \mapsto rH \times rW \times C$$

$$\mathcal{PS}(T)_{x,y,c} = T_{\lfloor x/r \rfloor, \lfloor y/r \rfloor, c \cdot r \cdot \text{mod}(y,r) + c \cdot \text{mod}(x,r)}$$

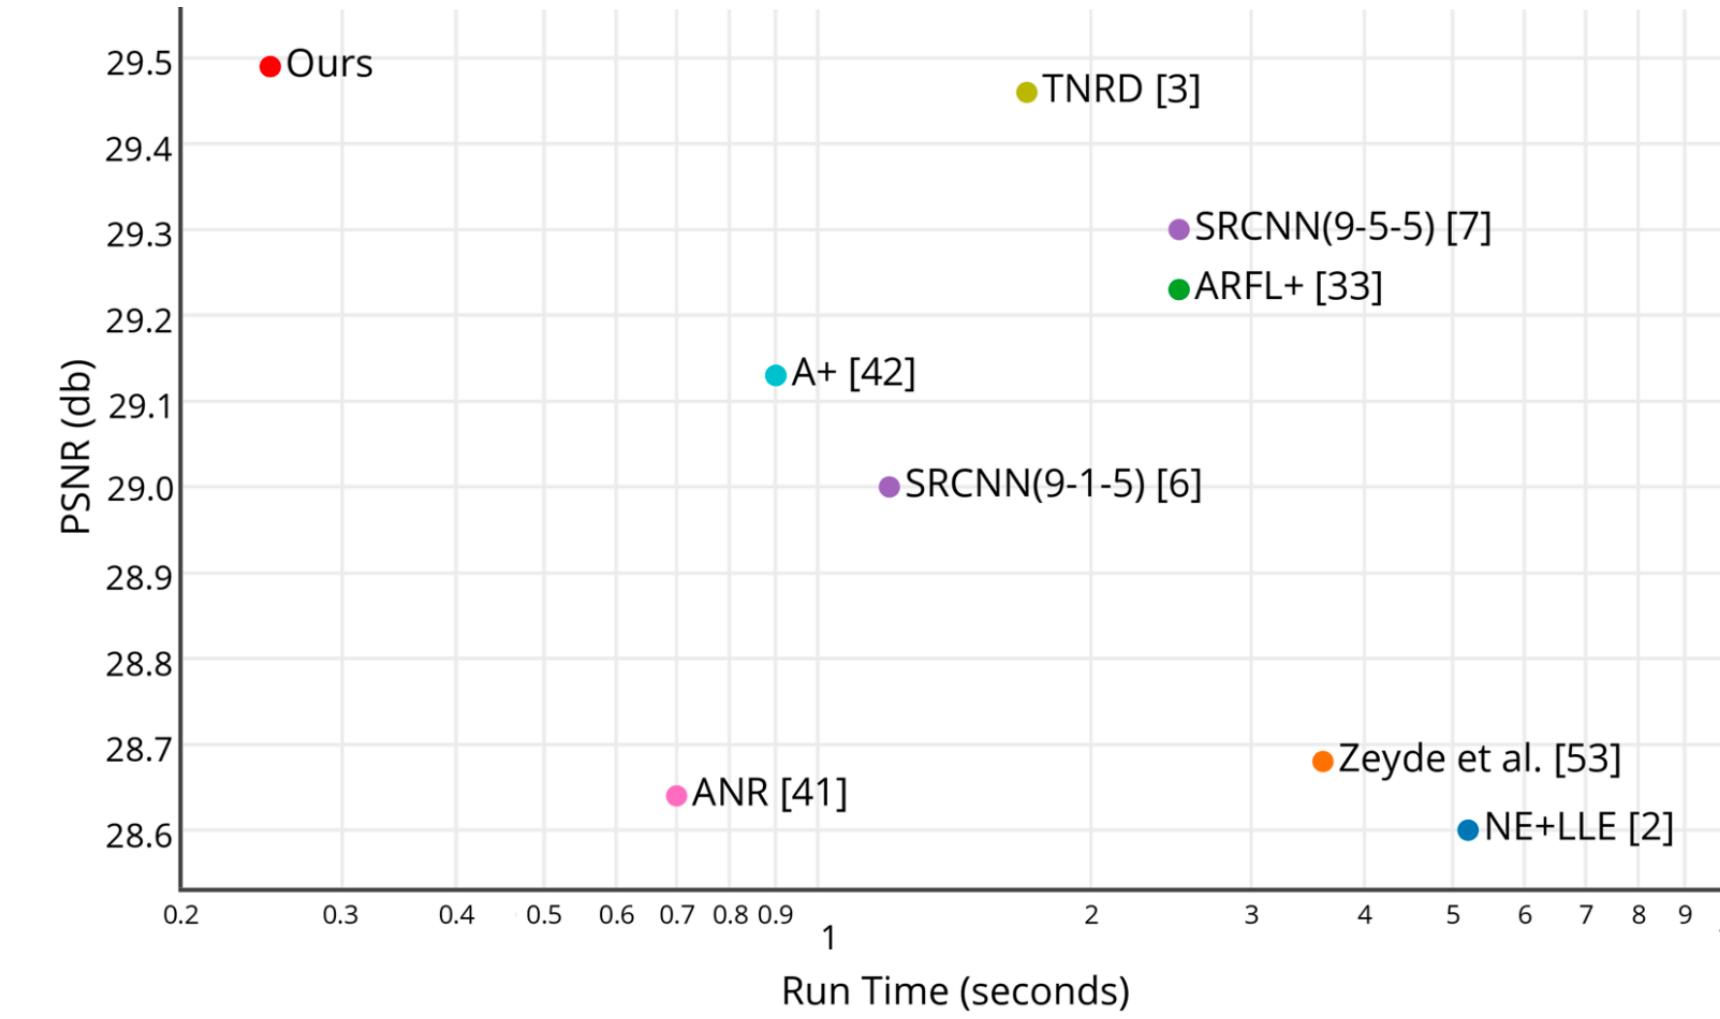

equivalent to a fractionally-strided convolution

convolution with stride $1/r$ in the LR space

with a filter W_s of size $k_s = rk_L$, but more efficient!

$$\ell(W_{1:L}, b_{1:L}) = \frac{1}{r^2 H W} \sum_{x=1}^{rH} \sum_{y=1}^{rW} (\mathbf{I}_{x,y}^{\text{HR}} - f_{x,y}^L(\mathbf{I}^{\text{LR}}))^2$$

The Unreasonable Effectiveness of Deep Features as a Perceptual Metric

Which patch (left or right) is “closer” to the middle patch in these examples?

Perceptual Distance: Is a red circle more similar to a red square or to a blue circle?

Berkeley-Adobe Perceptual Patch Similarity (BAPPS) Dataset

– Two Alternative Forced Choice (2AFC): Which of two distortions is more similar to a reference?

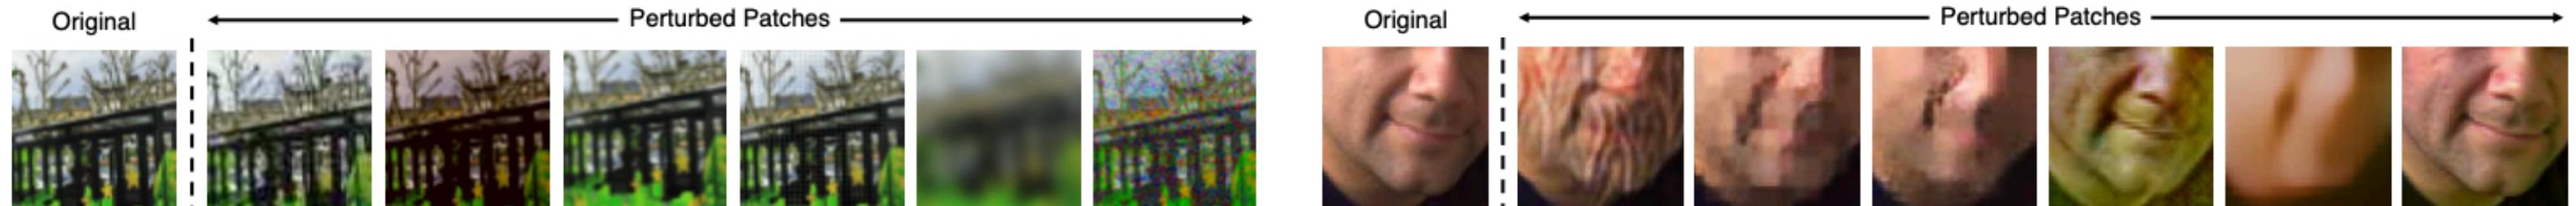

$x \rightarrow$ randomly selected image patch

$x_0, x_1 \rightarrow$ distorted patches

$h \in \{0, 1\} \rightarrow$ response of a human (which one is closer to the original patch?)

$\mathcal{T} \rightarrow$ dataset of patch triplets (x, x_0, x_1, h)

– Just Noticeable Difference (JND): Are two patches (one reference and one distorted) the same?

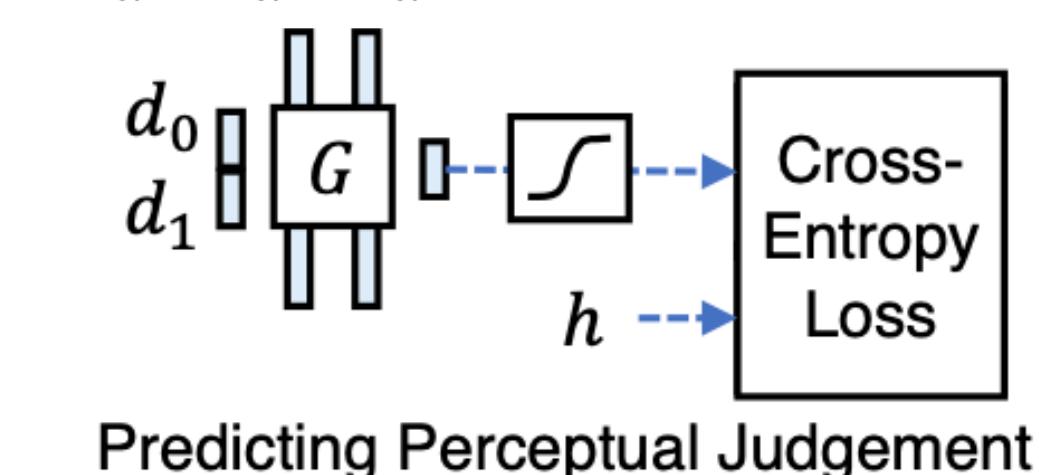

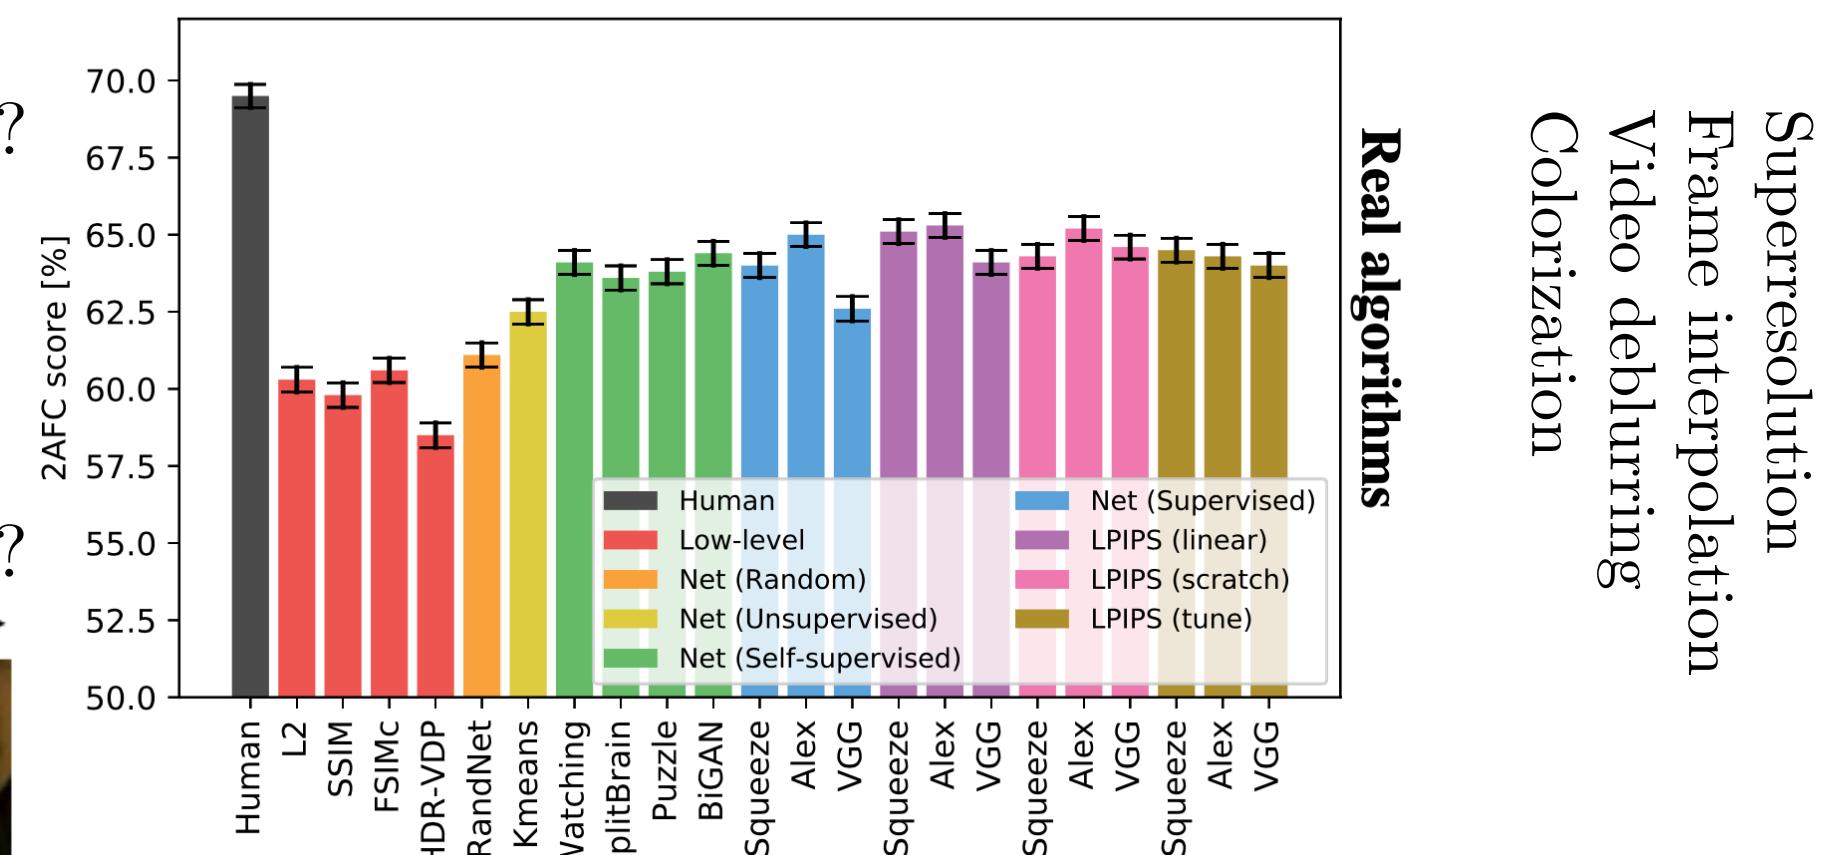

Learned Perceptual Image Patch Similarity (LPIPS) metric
Distance between reference and distorted patches x, x_0 with network \mathcal{F} :

$$d(x, x_0) = \sum_l \frac{1}{H_l W_l} \sum_{h,w} \|w_l \odot (\hat{y}_{hw}^l - \hat{y}_{0hw}^l)\|_2^2 \quad \hat{y}^\ell, \hat{y}_0^\ell \in \mathbb{R}^{H_\ell \times W_\ell \times C_\ell} \text{ for layer } \ell \quad w^\ell \in \mathbb{R}^C \rightarrow \text{scaling factor}$$

$$\|\hat{y}^\ell\| = \|\hat{y}_0^\ell\| = 1 \rightarrow \text{unit normalized in the channel dimension}$$

Zhang, Richard, et al. "The unreasonable effectiveness of deep features as a perceptual metric." *Proceedings of the IEEE conference on computer vision and pattern recognition*. 2018.
